

## CASE STUDY //

### Salford Town Hall

This development was completed in July 2015 on behalf of X1 developments. The iconic Salford Town Hall building was converted from its original use to form 134 apartments, predominantly student accommodation. This retrofit scheme again consisted of the design, supply and installation of the following, basement plant room, potable boosted cold water services, domestic hot water services, above ground drainage and rainwater services and gas supply system.

The client on this scheme chose to go for the Rehau system within the apartments, which meant all water services were taken from a manifold within the access in the bathroom, through to each individual appliance. This left no joints on the pipework throughout the apartments and proved to be a big success.
